Project Name	Garage Management System
Maximum Marks	2 Marks

Problem Statement:

In many automotive garages, daily operations such as job scheduling, vehicle tracking, customer management, billing, and inventory handling are managed manually or through disconnected systems. This often results in poor coordination, loss of data, delays in service delivery, and reduced customer satisfaction. Without a centralized system, tracking service history, managing mechanics' workload, and maintaining transparency with customers become difficult, leading to inefficiency and reduced profitability.

Proposed Solution:

We propose Garage Management System (GMS) — a cloud-based application developed on the Salesforce platform that:

- Centralizes customer, vehicle, and service data for easy access and management.
- Allows customers to book appointments and track service progress online.
- Enables staff to record diagnostics, repairs, and billing efficiently.
- Tracks spare parts and inventory levels in real-time.
- Generates analytical reports to monitor performance, revenue, and customer trends. The system streamlines garage operations, improves communication, reduces manual errors, and enhances overall customer satisfaction by providing a seamless and transparent experience.
