

PHASE 3 – PROJECT DESIGN PHASE

Problem–Solution Fit (Garage Management System)

Problem Identified

During the ideation phase, the core issues identified in automotive repair garages were **manual processes, delays in service communication, poor tracking, and lack of transparency**. Most garages still rely on paperwork or basic tools, which results in mismanaged service orders, inefficient mechanic assignment, customer dissatisfaction, and delays in billing and reporting.

Garages need a **centralized, reliable system** to manage bookings, repairs, inventory, billing, and customer updates in real-time.

The solution is to build a **Salesforce-based Garage Management System (GMS)** that automates daily garage activities, improves service quality, and enhances customer communication.

Problem–Solution Mapping

Identified Problem	Proposed Salesforce Solution
No centralized system to manage vehicle service requests	Salesforce Service Cloud to manage service cases & bookings
Manual job card creation and mechanic assignment	Automated job card creation using Flows + Assignment Rules
Delay in communication between customer and garage	Automated SMS/Email updates using Workflow/Omni-Channel
No real-time vehicle service tracking	Case Status Tracking + Milestones + Process Builder
Inventory not tracked properly (spare parts shortage or mismatch)	Inventory Management using Custom Objects & Validation Rules
Lack of transparency in billing and estimation	Auto-generated estimates and invoices using Salesforce Objects
Difficulty maintaining customer history	360° Customer View using Accounts, Contacts, and Service History
Manual reporting and no performance analytics	Dashboards & Reports for service efficiency, revenue, mechanic performance
